

1 **ABSTRACT OF THE DISCLOSURE**

2 A circuit breaker includes a body having a chamber defined therein. Two
3 terminals are provided in the chamber and extend out from the body. The first terminal
4 has a first node, and the second terminal has a bimetallic strip and a second node on the
5 bimetallic strip and electrically connected with the first node. A reset button is pivotally
6 mounted in the chamber and has a tab formed at a bottom side of and near the first
7 terminal. A swing member has a first pin pivotally mounted in the tab and a second pin
8 under the tab and connected with the first pin by a linkage. An elastic strip is received in
9 the tab and has a leg extending downwards to abut the second pin of the swing member.
10 Even if the reset button is blocked, the bimetallic strip still can deform to terminate the
11 circuit in an excessive-consumption condition.
